

## *Secure Shell Access (SSH): How can I enable SSH or Telnet on my website?*

First telnet is not offered with our service. We offer SSH which is very similar to telnet however it is secure. To enable SSH on your account all you have to do is fax a copy of your drivers license (both sides). Sign it and also include an IP address for your local computer at home. This will insure that security is in place and your IP and only your IP address is able to connect to our servers. Please note that if you need multiple locations include the IP's for that as well and it will be done. Please fax information to 905-272-9978 and let us know what you need done.
